RULE 9.1 INTRODUCTION

Mississippi's 2014 Section 303(d) List of Impaired Water Bodies fulfills the state's obligation with respect to §303(d) of the Federal Clean Water Act to develop a listing of the state's impaired waters. MDEQ provides two reports, this §303(d) list and a §305(b) report. These are not physically integrated, but the lists are meant to have a one-to-one relationship in that all of the water body segments found in the §305(b) report listed in category 5 are also listed in this document. This §303(d) document includes tables showing the impaired water bodies in each of the state's river basins. These basins are shown on the map on page 4.

- 1. Big Black River Basin
- 2. Coastal Streams Basin
- 3. North Independent Streams Basin
- 4. Pascagoula River Basin
- 5. Pearl River Basin
- 6. South Independent Streams and Lower Mississippi River Basins
- 7. Tennessee River Basin
- 8. Tombigbee River Basin
- 9. Yazoo River and Upper Mississippi River Basins

RULE 9.2 REGULATORY REQUIREMENT

Section 303(d) of the Clean Water Act and the implementing federal regulations at 40 C.F.R. §130.7 require the state to identify those waters within its jurisdiction for which effluent limitations are not sufficient to implement one or more applicable water quality standards and for which TMDLs are not yet completed. The state is to establish a priority ranking for such waters, taking into account the severity of the pollution and the designated uses to be made of such waters.

RULE 9.3 ASSESSMENT METHODOLOGY

A. Consolidated Assessment Listing Methodology (CALM)

All data used to make formal assessments of the quality of the state's waters, regardless of its source, are evaluated in keeping with the requirements and guidelines in the state's *Mississippi CALM [Consolidated Assessment Listing Methodology]* for 2014, [CALM] (MDEQ, 2013). Monitoring data and information that may be considered when assessing state waters could include chemical, physical, bacteriological, toxicological, and/or biological (e.g., macroinvertebrate, fish, and algal community measurements) data. In addition to using MDEQ-generated data, MDEQ solicits and considers all readily available data and information within the assessment window collected by other Federal, State, local agencies/organizations,

and the public. This data solicitation effort is facilitated through MDEQ's Basin Management Approach.

B. Designated Uses

The water quality assessment process begins with the collection and compilation of the available data followed by the analysis of water quality data and information for the purpose of determining the quality of the state's surface water resources. Surface waters in Mississippi are used for a number of purposes. Waters are used for drinking and food processing, shellfishing, recreation, fishing, and aquatic life use support (ALUS). Water bodies are designated and assigned various use classifications by MDEQ in the state's Water Quality Standards (11 Miss. Admin. Code Pt. 6, Ch. 2) {WQS}. This designation is made based on the use(s) of the water body as identified by the public and other entities. The use classifications and associated USEPA designated uses for water quality assessment purposes recognized by the State of Mississippi are as follows:

Use Classification USEPA Associated Designated Use

Public Water Supply
Recreation

Drinking Water Supply
Contact Recreation

Fish and Wildlife Aquatic Life Use, Fish Consumption, Secondary

Contact Recreation Shellfish Consumption

C. Water Quality Standards

Shellfish Harvesting

Most of Mississippi's waters are classified as Fish and Wildlife. For each of the use classifications listed above, there are various water quality criteria that apply to those water body uses. These standards are used in the assessment process. A water body (part or all of a stream, river, lake, estuary or coastline) should support one or more of these uses. The 2014 CALM and the WQS can be found online at

http://www.deq.state.ms.us/MDEQ.nsf/page/TWB Total Maximum Daily Load Section?OpenDocument

Mississippi's WQS specify the appropriate levels for which various water quality parameters or indicators support a water body's designated use(s). Each use assessed for a water body is determined to be either "Attaining" or "Not Attaining" in accordance with the applicable water quality standards and EPA guidelines for assessments pursuant to §305(b).

D. Assessment Categories

After assessing attainment status of the water body's designated use(s), each water body is assigned to an assessment unit that defines the length of the reach assessed and is placed into one of five assessment categories as per EPA guidance. These categories are summarized below

Assessment Categories	Definitions of Categories
Category 1	Attaining all uses
Category 2	Attaining some uses but there is insufficient data to determine if remaining designated uses are met
Category 3	Insufficient data to determine whether any designated uses are met
Category 4	Not attaining a use but a TMDL is not needed
4A	- TMDL has been completed
4B	- other required control measures will result in attainment of \overline{WQS}
4C	- impairment or threat not caused by a pollutant
Category 5	Not attaining a use and a TMDL is needed

The §303(d) list includes streams that are impaired that do not have the completed TMDL. Once the TMDL is completed, but prior to the stream being restored, MDEQ modifies the assessment category of the stream. An impaired stream without a TMDL is assessed in category 5. A stream with a TMDL, but still impaired, is assessed in category 4A. The §303(d) lists all of the category 5 waters. For a listing of the waters in category 4A, please visit the TMDL website at:

http://www.deq.state.ms.us/MDEQ.nsf/page/TWB Total Maximum Daily Load Section?OpenDocument

E. Monitoring Data

Assessments for 2014 are based on current site-specific monitoring data believed to accurately portray existing water quality conditions. A water body is considered monitored if sufficient (in quantity, quality, and frequency) physical, chemical, biological, bacteriological, and/or fish tissue data were collected and assessed on the water body data from January 1, 2008 to December 31, 2012.

Physical and chemical data include such parameters as pH, temperature, dissolved oxygen, toxicants, turbidity, total dissolved solids (TDS), and specific conductance. Biological data include the community structure of aquatic insects, other macroinvertebrates, fish, and/or algae. Bacteriological data include water column surveys for fecal coliform bacteria, E *coli*, or enterococci bacteria. Fish tissue data

include the analyses of fish flesh for the presence of toxic organic chemicals and metals. The length of record of the data, the quality of the data, and the frequency at which the data are collected were considered in making use attainment decisions.

For 2014, MDEQ considered all known and readily available information on the quality of the state's waters in conjunction with the rotating basin approach and MDEQ's §305(b) assessment program. However, only data that allowed for the accurate interpretation of the state's water quality standards or provided compelling evidence were used for §303(d) listing decisions.

RULE 9.4 FISH AND SHELLFISH CONSUMPTION ADVISORIES AND IMPAIRED WATERS

Non-attainment of the fish consumption use was assessed for a water body based on the presence of a fish consumption advisory supported by fish tissue monitoring data. Water bodies with fish consumption advisories, "restricted" or "no consumption," were assessed as not attaining the fish consumption use support designation.

Coastal water bodies with the Shellfish designated use that have consumption advisories are not included in the 2014 §303(d) List because these waters already have completed TMDLs for pathogens. These waters have a category 4a in the state's §305b report. These TMDLs are available for review on MDEQ's website.

RULE 9.5 LAYOUT OF THE TABLES

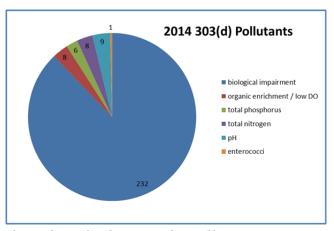

A. Stream Listings

The impaired waters in Table 2 are sorted alphabetically by the River Basin then by the water body name. The water body general location is given for the segment including a community located near the water body segment. The extent of the segment is described beginning with the upstream boundary thence to the downstream boundary. The maps of these segments are located in the appendix.

The historical or current water body ID along with the counties the segment is located is included. The impaired use refers to the designated use associated with the pollutant cause shown. In 2014, there is only one designated use included which is Fish & Wildlife. All uses are assessed; however, for 2014 MDEQ did not have any other uses impaired that do not already have completed TMDLs. Therefore, this is the only designated use included for 2014.

B. Pollutants Included

The pollutants are listed specifically for each listing. There are 264 listings for 2014. Biological Impairment is listed 232 times (87.9%). This listing is generated based on assessing the result of our microbiology program M-BISQ. When the water body is scored below the eco-regional value, it is added to the impaired waters list. A

stressor identification process is then used to identify the specific pollutants causing the microbiological impairment. Organic Enrichment, Total Nitrogen, and Total Phosphorus listings are for excessive nutrients or organics which impact the dissolved oxygen and eutrophication in the water body. The pH listings are from water monitoring results which are outside of the normal range for pH. If there are multiple pollutants and/or uses for a water body, these are shown as multiple listings for the water body.

C. Pollutant Source

Due to the nature of the monitoring and listings for 2014, the source of the impairment is generally not known. For the biological listings a stressor identification process is required to identify probable primary stressors. These are generally non-point source issues and source identification is difficult without specific analysis.

D. TMDL Due Date

Table 2 also gives the MDEQ due date for the TMDL and the year the segment was originally included in the §303(d) list. The due date, which is 13 years after initial listing, is determined from EPA guidance. To determine the new listings for 2014, Table 2 includes a column that shows the initial listing for each. All of the new listings this list are labeled 2014.

E. Changes Made For 2014

Table 3 provides the changes proposed for 2014 including all of the completed TMDLs since 2012, the monitored streams that are now fully supporting, and other changes made to the list. In addition, the EPA approval date as well as the federal NTTS TMDL tracking number is provided. The National TMDL Tracking System (NTTS) number is provided by EPA after the TMDL is finalized and approved. This becomes the identification number for that TMDL report.

For a more detailed description of the data and assessment steps taken, please refer to the state's 305b report. This report to Congress reviews all of the data collected and reports results both good and impaired on the states waters.

RULE 9.6 WATER BODY INDENTIFICATION NUMBERS

A. Historical Numbering System

The historical water body identification number for each water body listed contains a reference to the watershed of its location. Mississippi's river basins were divided into 482 watersheds. The specific location of a water body can be found by finding its ID next to a highlighted stream on one of the maps or by comparing the first three numbers in the water body's ID to the watershed numbers shown on the basin maps. For example, MS332S, Skuna River Canal, is located in watershed 332 near Buckhorn. There are a few of these identified segments on the 2014 list.

B. Exceptions to the Historical Numbering System

There are some exceptions within this numbering convention. Namely, when a water body serves as a boundary between two watersheds, the water body is identified by an abbreviation of the water body's name. For example, water body MSBGCHTRM2 is the identification for the Bogue Chitto River.

C. Intermediate Numbering System

In the 2002 and 2004 §303(d) lists, MDEQ used a numbering system based on identification of the river basin and the 11-digit USGS HUC system. This system was updated in 2006 and there are no longer any segments using this numbering approach.

D. Current Numbering System

MDEQ and USGS completed work on the new 12-digit watershed based delineation of Mississippi in 2005. MDEQ incorporated this new delineation into the identification numbering system for water body segments in the states 2006 §305(b) report. This will be used for future §303(d) waters added to the list.

The new delineated subwatersheds are smaller in size than the watersheds used in the 2004 list. Whereas the previous numbering system relied upon the river basins being divided into 482 watersheds, the new numbering system includes 1294 subwatersheds. Each new water body segment in the 2006 and 2008 lists were

identified by a six digit numeric code. This 2014 §303(d) list will use the same numbering system. The first digit identifies which basin contains the water body. The major river basins are numbered 1 through 9 in alphabetical order (1 for the Big Black River Basin, 2 for the Coastal Streams Basin, through 9 for the Yazoo Basin.) [See map on page 4.]

The next three digits in the six digit water body identification number refer to the specific subwatershed within that basin. Each major river basin has the subwatersheds it contains numbered beginning with 1 (subwatershed 146 located in the Big Black River Basin would be numbered 1146, subwatershed 74 located in the Pascagoula River Basin would be numbered 4074.) Within the Yazoo River Basin, the subwatersheds located in the Hills region are numbered beginning with 1 and the subwatersheds located in the Mississippi River Delta are numbered beginning with 500. The final two digits in the six digit water body identification number refer to a specific stream segment within the specified subwatershed. For instance, Beaver Creek, water body ID 521413, is stream segment 13 in subwatershed 214 in the Pearl River Basin.

E. Basin Maps

Maps are included in Appendix A for each basin. Streams shown in blue are the impaired stream segments. In some river basins, the maps were split into 8-digit Hydrologic Unit Codes to better fit the page.

RULE 9.7 TMDLs SCHEDULED FOR THE NEXT TWO YEARS

For water body listings added as a result of recent monitoring, MDEQ anticipates developing these TMDLs within 13 years of the original listing. The TMDL projected completion dates given in Table 2 are based on plans developed between MDEQ and EPA for TMDL development for the next two years. These dates are given for information only and are not a commitment by MDEQ of TMDL completion. TMDLs will be prioritized based on the pollutant of concern, the basin plan rotation, and the designated use of the water.

Table 1 below lists the TMDLs MDEQ has planned for development in 2014 and 2015 based on resource availability and water body pollutant combinations. These TMDLs are also relying on completion of stressor identifications on the biological listings included.

RULE 9.8 PUBLIC PARTICIPATION AND APPROVAL PROCESS

MDEQ notified the public of the availability of this document by publishing a Public Notice in a statewide newspaper as well as selected regional newspapers. Additionally, MDEQ sent notices of availability to those addressees on the TMDL notification list.

The public was invited to comment on the content of this document. The Public Notice period began on March 10, 2014 and went until April 10, 2014. Comments were requested by mail or electronic submission and in person at a Public Hearing held in MDEQ's offices on April 10, 2014. This proposed document will be submitted to the Mississippi Commission on Environmental Quality for adoption. Once adopted by the Commission, the 2014 §303(d) List will be submitted to EPA Region 4 for final approval, and then the Mississippi 2014 §303(d) List of Impaired Water Bodies will be filed with the Mississippi Secretary of State in compliance with state law.
