These test results only relate to the materials sampled. The results apply to the samples as received. All percentages given are by visually estimated area percentage for each type of asbestos present. All analysis is performed in accordance with the EPA "Interim Method for the Determination of Asbestos in Bulk Insulation Samples" as found in 40 CFR, Part 763, Subpart E, Appendix E and EPA "Method for the Determination of Asbestos in Bulk Building Materials, EPA/600/R-93/116, 1993". Non-homogeneous samples are divided into homogeneous layers for analysis. Each layer is reported as a sub-sample of the original sample. PLM is not consistently reliable in detecting small concentrations of asbestos in floor tiles and similar nonfriable materials. Quantitative TEM is currently the only method that can be used to determine the conclusive asbestos content. BH&M Environmental Consultants, Inc. maintains liability limited to the cost of analysis. BH&M Environmental Consultants, Inc. bears no responsibility for sample collection activities or analytical method limitations. The report may not be reproduced, except in full, without the approval of BH&M Environmental Consultants, Inc. It is verified by signature that the laboratory identified is accredited by the NVLAP Asbestos Fiber Analysis Program, Laboratory ID #201018-0. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government. \* Denotes information provided by client.
