Farm # 2356 Tract # 8431 GPS Coordinates: 31°15'52.79"N 90°19'56.49"W

The purpose of this project is to prepare pads for 2 Broiler houses 46' X 600' in size. This site is located in Southeast Pike County about 9 miles East of McComb, necessary to achieve pad length with required approaches.

SITE DESCRIPTION: (Before)

The site has generally rolling topography with 2 to 5 percent slopes for most of the area to be disturbed. There is no sign of erosion at this time.

SITE DESCRIPTION: (After)

Impervious areas will increase from 0 to 4 acres which will be under roof. An approximately 500' access road will be constructed from the public road to the site. This road will be covered with all-weather material such as gravel or approved fill dirt. Each poultry house will be approximately 46' x 600' with an area 50' between each house for access roads. The 10-year 24 hour storm event will be used to design runoff controls. The large area of tin roofs and quick runoff will be considered.

ADJACENT PROPERTY:

All surrounding property is agricultural or wooded. . All runoffs should travel from North to South direction.

SOILS:

The area in the construction site is mapped in the soil survey as Cahaba and Mantachie. This moderately well-drained soil has a grayish-brown, silt loam to loam surface layer, which overlies a yellowish-brown to strong-brown silt loam to loam subsoil. A mottled yellow, brown, and gray fragipan of clay loam texture begins at a depth of 16 to 20 inches. This fragipan overlies mottled red, yellow, and gray loam to clay loam.

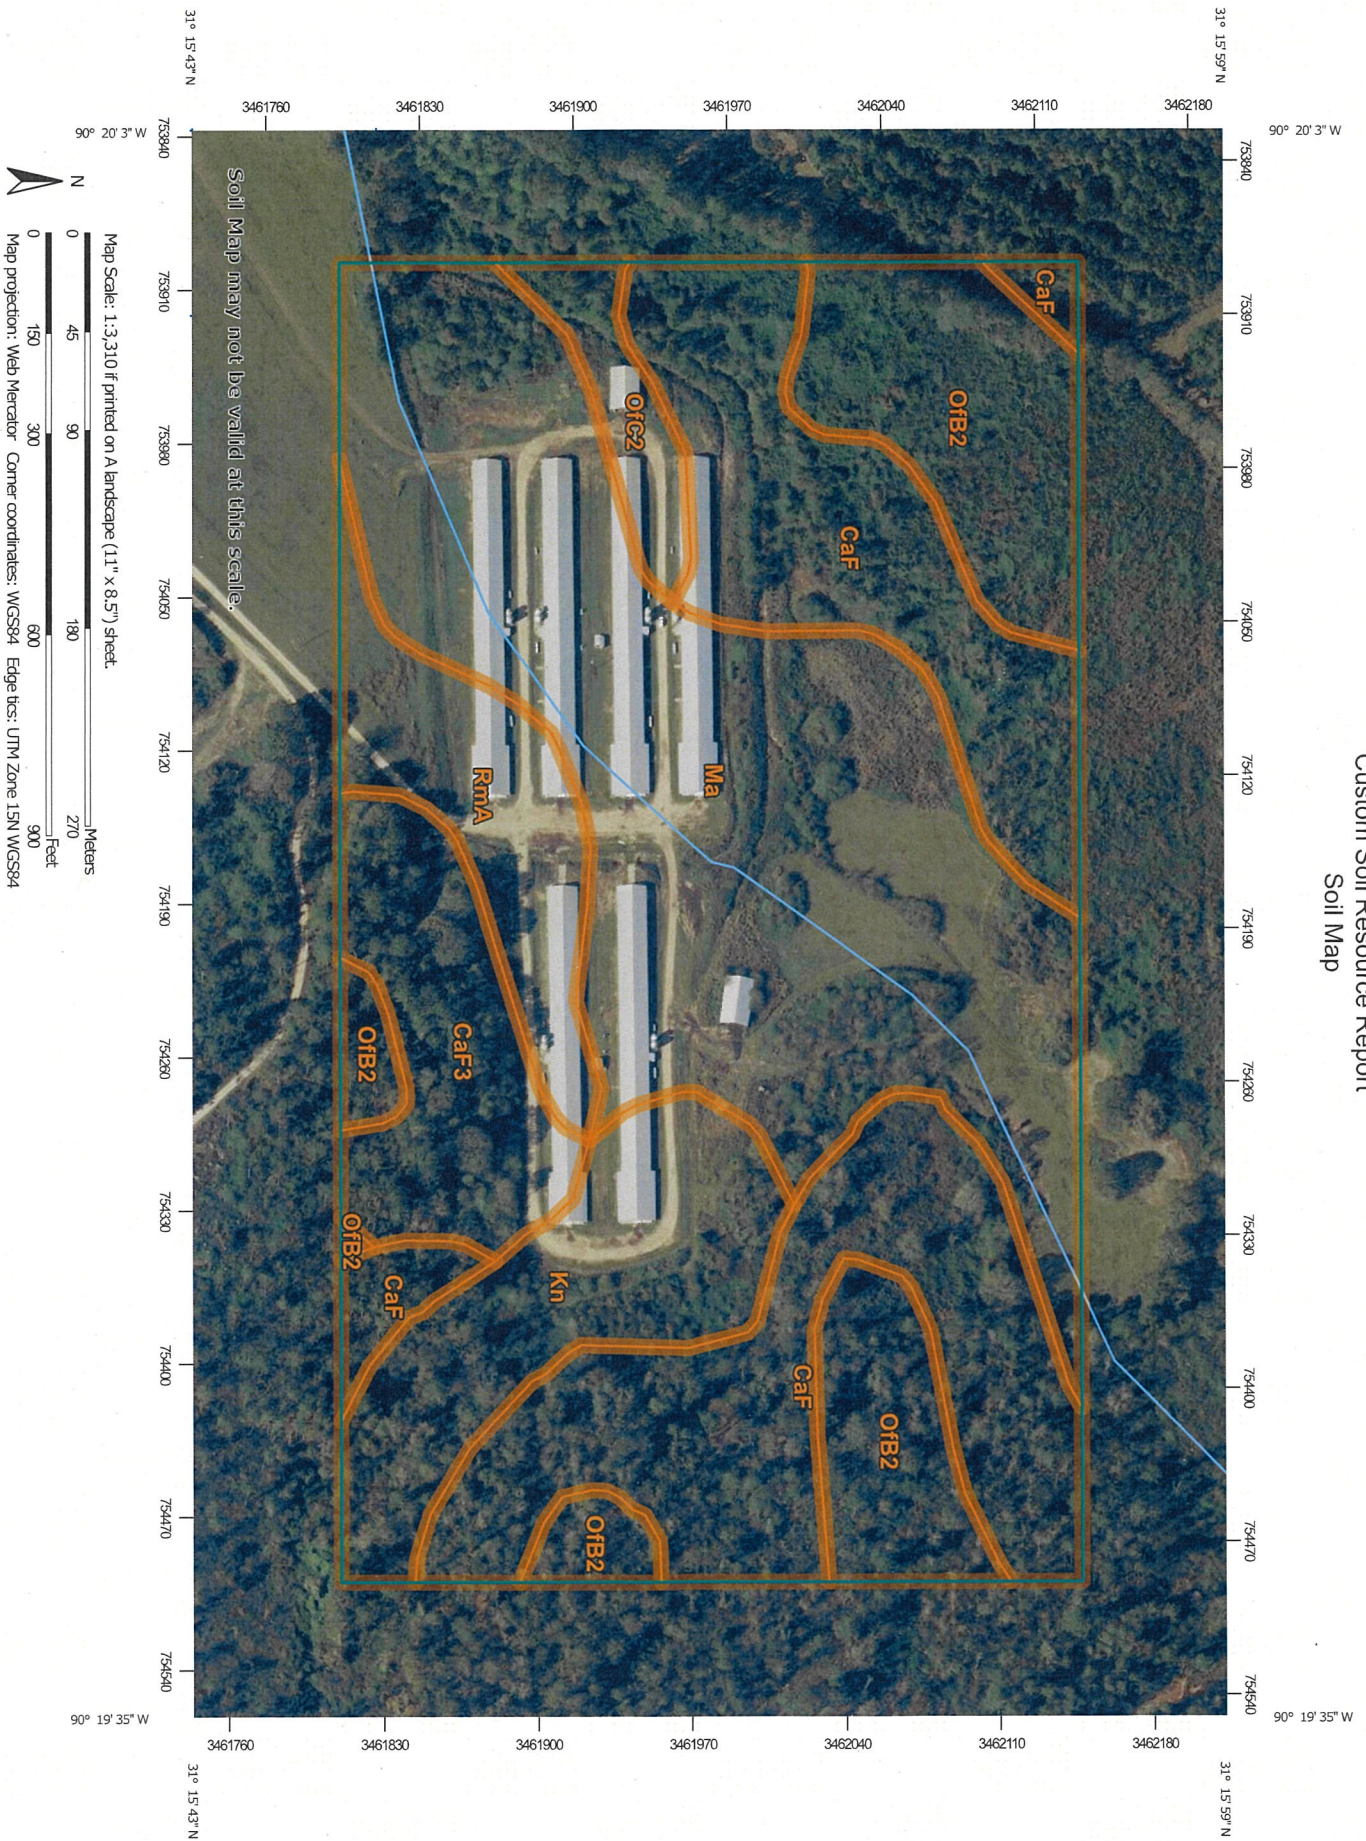

PLANNED EROSION, SEDIMENT, AND STORMWATER CONTROL PRACTICES:

1. A 100' minimum buffer zone of permanent grass sod will be maintained all around the construction site while construction is going on. This zone will be maintained by fertilization, weed control, grazing, limitations, and equipment exclusions.
2. Temporary seeding with a straw mulch will be used whenever disturbed areas are to be unworked for more than 30 days.
3. Hay bale fences will be used to control sediment on cut or fill slopes and areas of stockpiled topsoil.
4. See attached sheet for recommended slopes and vegetative requirements.

MAINTENANCE PLAN:

1. All erosion and sediment control practices will be checked for stability and operation following every run-off producing rainfall, but in no case less than once every week. Any additional repairs will be made immediately to maintain practices.
2. All seeded areas will be fertilized, reseeded as needed, and mulched according to specification to maintain a vigorous vegetative cover throughout the construction phase of the project.
3. After construction is completed, any exposed areas will be fertilized and mulched in accordance to vegetative requirements.

System Description

This comprehensive nutrient management system is planned to accommodate waste from broilers at an average market weight of 3.5 pounds. This operation normally averages 6 flocks per year with a flock life of 50 days. This system is planned to spread litter on the application areas shown within this plan. Broiler litter is not used on this Farm and will be transported off-site.

This is an existing 6 house broiler poultry operation. New construction is planned for 2 new 46'x 600' houses.

Nutrient Balance

The nutrients available in the waste must not exceed the agronomic requirements for the yield goals of the forages. The attached worksheets application rates based on estimated nutrient content of the waste and nutrient uptake of the plants. The Phosphorus Index was calculated for each field to determine the application rate basis. It is required that samples of the waste to be applied be taken to determine the actual nutrient content of the waste. Testing of soil samples is recommended to determine the actual needs of the plants and soils. Application rates should be adjusted accordingly. Estimated application rates for individual fields, soils, forages and cropping system can be found on the Nutrient Management Worksheets found in this CNMP. These rates shall be adjusted for changes in cropping systems, yields, and forage type.

Broiler litter production is estimated to be 1852 tons per year. Allowing for nitrogen losses in storage, application, and denitrification and for the amount of phosphorus that will be mineralized or bound to the soil, about 58.4 pounds of nitrogen, 48.3 pounds of phosphorus, and 43.5 pounds of potash would be available for crop uptake from the waste.

All litter will be transported off site by Cody Williams and shall be documented on the Producers Log.

a. Entered analysis may be the average of several individual analyses.

b. Mississippi assumes that 90% of manure phosphorus and 90% of manure potassium is crop available. First-year per-acre nitrogen availability for individual manure applications is given in the Planned Nutrient Applications table. For more information about nitrogen availability in Mississippi, see Tables 4 and 5, Nutrient Management 590 Animal and Manure Information (http://efotg.nrcs.usda.gov/references/public/MS/Animal_and_Manure_Information.pdf).

Have entered into an agreement that the above mentioned contractor will remove the chicken litter and/or chicken compost from the above mentioned poultry operation. Once the litter and/or compost is removed from the Producer's poultry operation it becomes the Contractor's sole responsibility to ensure that the litter and/or compost material is placed on lands in accordance with siting criteria for land application requirements established by Mississippi Department of Environmental Quality, Office of Pollution Control, and at an application rate not to exceed 4 tons/acre/application. Further, if any or all of the litter/compost is to be transported to another state, it becomes the Contractor's responsibility to dispose of the litter/compost material in a manner which shall comply with that state's land application or commerce requirements.
